

SmagerUp Core (SUC) - System Documentation

Overview

SmagerUp Core (SUC) is the central backend platform of the SmagerUp ecosystem.

It securely hosts, licenses, and manages JavaScript modules and libraries used by SmagerUp Studio (SUS) - the visual app builder.

This document summarizes the system architecture, interaction flow, and technical overview of SUC and SUS.

System Architecture Overview

1. SmagerUp Core (SUC): The backend API that handles authentication, module management, and license validation.
2. SmagerUp Studio (SUS): The app builder that connects to SUC for verified module access and license-controlled development.

Key Features of SUC

- Authentication & JWT-based Authorization
- License validation per module (Free or Paid)
- Module hosting and versioning
- Account and API key management
- Integration with SmagerUp Studio (SUS)

Data Flow Summary

1. SUS authenticates with SUC using account ID and API key.
2. SUC issues JWT token for secure access.
3. SUS requests modules through SUC API.
4. SUC validates license and returns authorized modules.
5. SUS dynamically builds applications using modules from SUC.

License Types Example

1. SFUL - SmagerUp Free Use License (FreeUseNonModifiable)
Free to use but cannot modify source code.
2. SCL - SmagerUp Commercial License (PaidNonModifiable)

Paid license intended for commercial use.

Core Database Tables

- Accounts: Registered users and API keys.
- LicenseTypes: Master license definitions (SFUL, SCL).
- Modules: Hosted JavaScript libraries with license and version info.
- AccountModules: Tracks module access per account.
